Broadhead Aftercare

Thank you for your purchase of Kayuga broadheads, your support is greatly appreciated.

Just a few quick things to ensure you get the most out of your product

- Please ensure your broadheads are as tight as you can get them! Especially with the Pilot Cuts as they have a rotational cutting style at the time of impact the total stress of the arrow and broadhead is all at the point of the thread in the insert and by design they self-tighten upon impact. We highly recommend you use a bit of string wax on the threads, this firstly acts like a thread locker. Secondly prevents the threads from binding up or seizing and lastly creates a bit of a seal to prevent blood and moisture getting inside your arrow shaft.
- Ensure your broadheads are sharp before hunting. Our website www.kayugabroadheads.com.au has some instructional videos to assist you in sharpening. Remember that a single bevel head may not feel as sharp as a traditional double bevel as the blade angles are steeper similar to that of industrial scissors or shears, but rest assured if you get a burr that stands up beneath it is a deadly edge.
- On the old-school range it is important to tip the broadhead by filing any of the following styles; tanto tip, drop point, spear tip or chisel tip, we use and recommend a tanto tip but as it's a personal preference we leave that up to you. Keep in mind if you're happy with the needle point then you need not worry.
- If you have any issues or any questions please don't hesitate to contact us via Facebook, Instagram, Check the website page "tips and useful info" or email us at broadheads@kayugabroadheads.com.au remember our service doesn't end after the sale

Kind Regards
the Team at Kayuga Broadheads
